

Use Cases for Machine Learning for Cyber Security

Dr Cyril Onwubiko
C-MRiC.ORG

Workshop on Machine Learning for Cyber Security

11th March 2019

C-MRiC.ORG[®]

**Centre for Multidisciplinary Research,
Innovation and Collaboration**

Machine Learning is applied in Cyber Security to detect emerging and sophisticated attacks, especially around 'point solutions', e.g. **Endpoint detection, Botnets, DNS security, Transaction monitoring and Analytics.**

And what are the things Machine Learning for Cyber Security may **not** be ideal?

C-MRiC.ORG[®]

**Centre for Multidisciplinary Research,
Innovation and Collaboration**

Unsupervised
(no labels)

Supervised
(with labels)

Incremental
(Learn continuously)

User behaviour analysis

Insider threat detection

Network traffic profiling

Network anomaly detection

Spam filtering

Batch
(Learn only once or in discrete steps)

Malware family identification

C2 detection

Malware detection

[1] Scott Miserendino, BluVector Inc.

The problem one is trying to solve dictates the data, feature and ML algorithms used [1]

Innovation and Collaboration

Case Studies

- **Malware Detection**
 - Malware detection, **network-based attack detection** and code detection and C2 & Bots
- **Profiling & Security Analytics**
 - User & Entity profiling, **behavioural analytics**, big data, security and web analytics etc
- **Cyber Security Operations Centre**
 - Security Monitoring, Flow Analysis, Log Collection & Collation, Correlation, Analysis, and Cyber Incident Management and '**Human-in-the-loop**' etc

C-MRiC.ORG[®]

Centre for Multidisciplinary Research,
Innovation and Collaboration

Malware Detection

- Intrusion detection systems (IDS) using Rule-based, Heuristic, Machine Learning - Supervised & Unsupervised Learning
- Detect **Bot / C2 (Command & Control)**
- Correlating Intrusion detection **alerts** on Bot malware infections
- Content inspection – content is inspected against feature set of malignant (**malicious**) content
- Temporal heuristic & behavioural analysis
- **Featureless Engineering** for Anomaly detection

C-MRiC.ORG[®]

Centre for Multidisciplinary Research,
Innovation and Collaboration

Feature Engineering

- Cost – Expensive
- Domain Experts / Domain Knowledge
- Data Scientist
- Complex and Convolutated
- Tedious

Parsers /
Plugins

UserData
Fields
Features

Feature engineering, while generally known to boost classification metrics, however, it creates a need for substantial investment of expensive and scarce data science expertise. We find that reliance on domain expertise and feature engineering severely inhibits the feasibility of applying existing correlation and filtering methods in practice [2]

Features, Reliability & Relevance

Indicators of Compromise (IoC)

- Constantly evolving features
- Feature Reliability & Relevance

Features	Features	Features	Features
IP Address (IPv4 or IPv6)	FilePath	FileHASH-SHA256	Encrypt-AES256
Domain	CIDR	FileHash-IMPHASH	Encrypt-AES128
Hostname	CVE	Mutex	Encrypt-AES224
FQDN	Email	SSDeep /CTPH [3]	Encrypt-DES
URL	FileHash-MD5	GeoIP	Encrypt-Unknown
URI	FileHASH-SHA1	DNS	YARA

Feature Engineering Conundrum

1

- Netflix Prize
 - The **Netflix Prize** was an open competition for the best collaborative filtering algorithm to predict user ratings for films, based on previous ratings without any other information about the users or films, i.e. without the users or the films being identified except by numbers assigned for the contest [3].
 - Cost millions in dollars
 - Took almost 3 years (2 Oct 2006 – 18 Sept. 2009)
 - Won by BellKor's Pragmatic Chaos

[3] Wikipedia – https://en.Wikipedia.org/wiki/Netflix_Prize

Feature Engineering Conundrum

2

- IBM DeepQA
 - The **IBM DeepQA Project** was commissioned to build **Watson**.
 - Real language is real hard for computers to grasp. The meaning behind **words** is implicit, ambiguous and highly contextual.
 - The underlying philosophy of our research approach is that **true intelligence** will emerge from the development and integration of **many different algorithms** each looking at the data from different perspectives. No one programmer, no one program design from top to bottom will have all it needs to **understand language**. Rather a system must **evolve from the continuous contribution of many different algorithms**. These must all balance and combine to form a holistic and accurate interpretation of the intended meaning. DeepQA is a software architecture for deep content analysis and evidence-based reasoning that embodies that philosophy [4].

Innovation and Collaboration**

Deep Learning - Conundrum

3

- Uses advanced natural language processing, semantic analysis, information retrieval, automated reasoning and machine learning.
- DeepQA deeply analyzes natural language input to better find, synthesize, deliver and organize relevant answers and their justifications from the wealth of knowledge available in a combination of existing natural language text and databases.
- Involves 6 collaborating Universities
- 25 IBM Researchers
- In 4 years

Featureless Engineering & without Domain Expertise

- A case study of Filtering & Correlation of IDS Alerts
 - IDSs produce high volumes of logs/alerts, raise high false positives
 - Reliability / Trust?
 - Alert \neq Incident
- **Proposal** Neural Networks + Latent Semantic Analysis (LSA) [5] to avoid feature engineering – promising result as reported in [5]

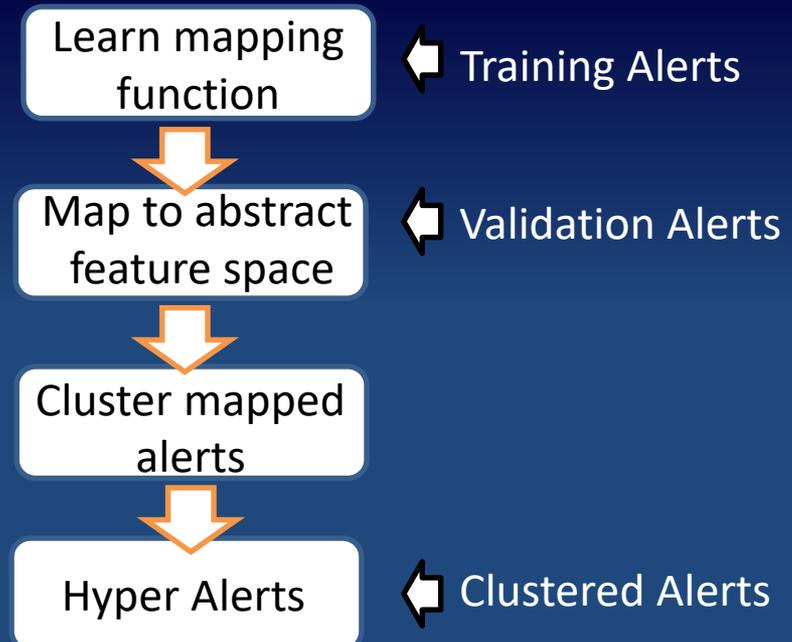

[5] Egon Kidmose – PhD Thesis – Network-based Detection of Malicious Activities – A Corporate Network Perspective, 2018

C-MRiC.ORG[®]

Centre for Multidisciplinary Research,
Innovation and Collaboration

An Approach

- Use Long Short-Term Memory (LSTM) Recurrent Neural Network (RNN) and Latent Semantic Analysis (LSA)
 - Alerts → Hyper Alerts (fusion)
 - Alerts are human readable strings of texts
 - Eliminates need for feature engineering and issues of maintenance and adaptability
- **Proposal** LSTM RNN architecture is used to learn from labelled alerts
- LSA is then applied to unlabeled alerts (see implementation on [5 & 6])

Cyber Security Operations Centre

- **Technology**

- Tools and technologies used to monitor the network, ranging from ML Anomaly detection, sensors, AV, firewalls, SIEM etc. These tools automatically detect and alert when a potential incident occurs

- **Process**

- Processes, policies and procedures leveraged by SOC to monitor, operate and conduct cyber incident investigation, such as incident playbooks, cyber incident management process etc.

- **People**

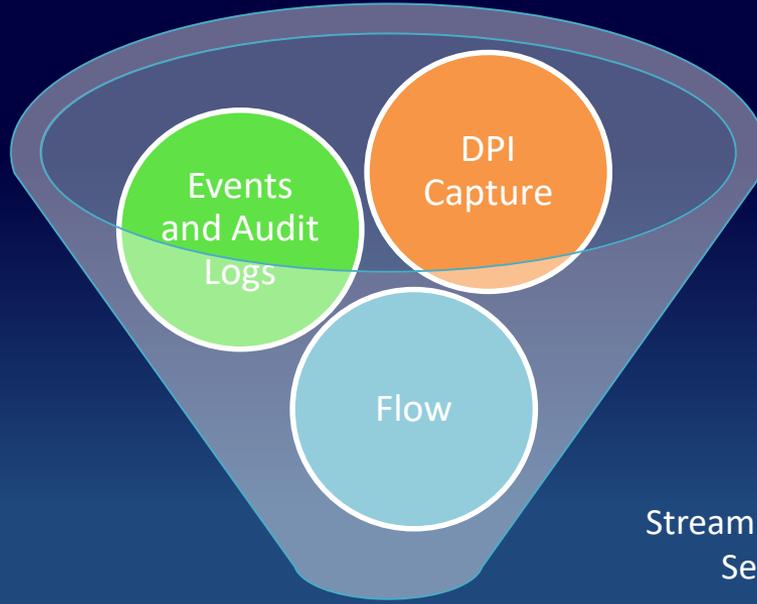

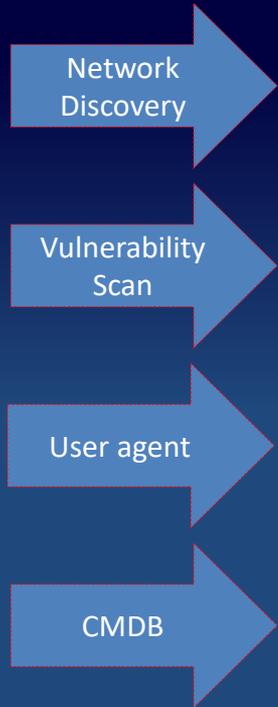

- Analysts, Operators, Administrators & Incident Responders, Threat Hunters etc. who operate, monitor and coordinate cyber incident response, leveraging **technology** and **process**

Conclusion

- AI, ML & DL have been applied to solve Cyber Security real-life problems ranging from malware detection to correlation of alerts and behavioural analytics.
- While ML is extremely useful, feature engineering can be complex and expensive and requires domain expertise and data science, both of which are scarce and come at a premium.
- Human-in-the-loop is and will still be needed in Cyber Security.
